

Solving linear simultaneous equations using the elimination method

A LEVEL LINKS

Scheme of work: 1c. Equations – quadratic/linear simultaneous

Key points

- Two equations are simultaneous when they are both true at the same time.
- Solving simultaneous linear equations in two unknowns involves finding the value of each unknown which works for both equations.
- Make sure that the coefficient of one of the unknowns is the same in both equations.
- Eliminate this equal unknown by either subtracting or adding the two equations.

Examples

Example 2

Example 1 Solve the simultaneous equations 3x + y = 5 and x + y = 1

3x + y = 5 $- x + y = 1$ $2x = 4$ So $x = 2$	1 Subtract the second equation from the first equation to eliminate the <i>y</i> term.
Using $x + y = 1$ 2 + y = 1 So $y = -1$	2 To find the value of y, substitute $x = 2$ into one of the original equations.
Check:	3 Substitute the values of x and y into

equation 1: $3 \times 2 + (-1) = 5$ YES equation 2: 2 + (-1) = 1 YES

Solve
$$x + 2y = 13$$
 and $5x - 2y = 5$ simultaneously.

$$x + 2y = 13$$
1 Add the two equations together to

$$\frac{+ 5x - 2y = 5}{6x = 18}$$
So $x = 3$
Using $x + 2y = 13$
 $3 + 2y = 13$
So $y = 5$
Check:
equation 1: $3 + 2 \times 5 = 13$ YES
equation 2: $5 \times 3 - 2 \times 5 = 5$ YES

eliminate the *y* term.

both equations to check your

2 To find the value of y, substitute x = 3 into one of the original equations.

3 Substitute the values of *x* and *y* into both equations to check your answers.

Example 3 Solve 2x + 3y = 2 and 5x + 4y = 12 simultaneously.

$$(2x + 3y = 2) \times 4 \rightarrow 8x + 12y = 8$$

 $(5x + 4y = 12) \times 3 \rightarrow 15x + 12y = 36$
 $7x = 28$

So
$$x = 4$$

Using
$$2x + 3y = 2$$

 $2 \times 4 + 3y = 2$
So $y = -2$

equation 1:
$$2 \times 4 + 3 \times (-2) = 2$$
 YES equation 2: $5 \times 4 + 4 \times (-2) = 12$ YES

- 1 Multiply the first equation by 4 and the second equation by 3 to make the coefficient of *y* the same for both equations. Then subtract the first equation from the second equation to eliminate the *y* term.
- 2 To find the value of y, substitute x = 4 into one of the original equations.
- 3 Substitute the values of x and y into both equations to check your answers.

Practice

Solve these simultaneous equations.

$$1 4x + y = 8
 x + y = 5$$

$$3x + y = 7$$
$$3x + 2y = 5$$

$$3 4x + y = 3$$
$$3x - y = 11$$

$$4 3x + 4y = 7$$
$$x - 4y = 5$$

$$5 2x + y = 11$$
$$x - 3y = 9$$

$$6 2x + 3y = 11$$
$$3x + 2y = 4$$

Solving linear simultaneous equations using the substitution method

A LEVEL LINKS

Scheme of work: 1c. Equations – quadratic/linear simultaneous Textbook: Pure Year 1, 3.1 Linear simultaneous equations

Key points

The substitution method is the method most commonly used for A level. This is because it is the method used to solve linear and quadratic simultaneous equations.

Examples

Example 4 Solve the simultaneous equations y = 2x + 1 and 5x + 3y = 14

$$5x + 3(2x + 1) = 14$$
 $5x + 6x + 3 = 14$
 $11x + 3 = 14$
 $11x = 11$
So $x = 1$
Using $y = 2x + 1$

1 S

2 H

4 T

Using
$$y = 2x + 1$$

 $y = 2 \times 1 + 1$
So $y = 3$

Check: equation 1: $3 = 2 \times 1 + 1$ equation 2: $5 \times 1 + 3 \times 3 = 14$ YES

- 1 Substitute 2x + 1 for y into the second equation.
- **2** Expand the brackets and simplify.
- 3 Work out the value of x.
- 4 To find the value of y, substitute x = 1 into one of the original equations.
- Substitute the values of x and y into both equations to check your answers.

1 Rearrange the first equation.

2 Substitute 2x - 16 for y into the

Example 5 Solve 2x - y = 16 and 4x + 3y = -3 simultaneously.

$$y = 2x - 16$$

$$4x + 3(2x - 16) = -3$$

$$4x + 6x - 48 = -3$$

$$10x - 48 = -3$$

$$10x = 45$$
So $x = 4\frac{1}{2}$
Using $y = 2x - 16$

$$y = 2 \times 4\frac{1}{2} - 16$$
So $y = -7$
Check:

equation 1: $2 \times 4\frac{1}{2} - (-7) = 16$ YES

second equation. **3** Expand the brackets and simplify. Work out the value of x. 5 To find the value of y, substitute $x = 4\frac{1}{2}$ into one of the original equations. Substitute the values of x and y into both equations to check your answers. equation 2: $4 \times 4\frac{1}{2} + 3 \times (-7) = -3$ YES

Practice

Solve these simultaneous equations.

$$7 y = x - 4$$
$$2x + 5y = 43$$

9
$$2y = 4x + 5$$

 $9x + 5y = 22$

11
$$3x + 4y = 8$$

 $2x - y = -13$

13
$$3x = y - 1$$

 $2y - 2x = 3$

8
$$y = 2x - 3$$

 $5x - 3y = 11$

10
$$2x = y - 2$$

 $8x - 5y = -11$

12
$$3y = 4x - 7$$

 $2y = 3x - 4$

14
$$3x + 2y + 1 = 0$$

 $4y = 8 - x$

Extend

15 Solve the simultaneous equations 3x + 5y - 20 = 0 and $2(x + y) = \frac{3(y - x)}{4}$.

Answers

1
$$x = 1, y = 4$$

2
$$x = 3, y = -2$$

3
$$x = 2, y = -5$$

4
$$x = 3, y = -\frac{1}{2}$$

5
$$x = 6, y = -1$$

6
$$x = -2, y = 5$$

7
$$x = 9, y = 5$$

8
$$x = -2, y = -7$$

9
$$x = \frac{1}{2}, y = 3\frac{1}{2}$$

10
$$x = \frac{1}{2}, y = 3$$

11
$$x = -4, y = 5$$

12
$$x = -2, y = -5$$

13
$$x = \frac{1}{4}, y = 1\frac{3}{4}$$

14
$$x = -2, y = 2\frac{1}{2}$$

15
$$x = -2\frac{1}{2}, y = 5\frac{1}{2}$$
